# Documentation for the Standardization of the Italian Harmonized <br> Histories Data File for birth, partnership histories, leaving home questions and background variables 

# HARMONIZED HISTORIES Italy (9570 respondents <br> age 18 to age 64) 

Karolin Kubisch<br>Max Planck Institute for Demographic Research Rostock

2012
Updated 3.6.2014
Updated 27.10.2015
Update 11.04.2019

```
The following document gives a description of all input variables and
the consequent preparation of the output variables according to the
manual for the preparation of comparative fertility and union
histories.
Missing values are coded:
.a unknown
.b does not apply
.c unavailable in survey
Source: GGS First Wave, UN version 2019: GGS_Wave1_Italy_V.4.3.dta
Interview dates Italy GGS: 2003
June 2014: Corrections in the variables to leaving home histories of
children (KID_L, KID_LY, KID_LM)
October 2015: Please note that the partnership histories were modified
in October 2015. More precisely, we changed the sorting of the variable
UNION_$ (Union order). Prior to that date, we had sorted the unions by
start year of the union. This involved that unions which start dates
were missing were always listed as last unions. In the modified
version, we sorted the partnerships no longer by relying on the start
year of the union, but by relying on the order of the union as they
appear in the original dataset. For Italy it affects 0 cases.
In connection with this modification, some smaller consistency changes
were made to the data. In particular, we recoded the following
constellations:
- Events (Union, Marriage, Separation, Divorce) before age 12 of respondent
- Event before age 12 of partner
- Negative difference between partnership date and marriage date
- Negative difference between separation date and union or marrige date and negative difference between divorce date and union or marriage date
```

```
    - Sucessive partnerships mar-mar[_n-1]<=0 or par-par[_n-1]<=0
    - Differences between separation date and next partnership date
    sep>par[_n+1]
All modifications made October 2015 are described in the updated
documentation.
2019: Version 4.3. was used, Year of birth for children living in
household at interview was constructed from Year of survey and age at
interview
```

NOT INCLUDED IN SURVEY

\section*{KID_L\$: Child left home}

Child's parental home leave variable (KID_L) was not constructed perfectly as it was created in wide format instead of long. Namely the error occurred assuming that child's order would perfectly match of those living outside the household. More specifically, if child from outside household changes its order (because of preceding foster/adopted or a step child) and in household grid is reported biological child of the same order, then this particular child will be coded as " 0 " (did not leave home). Furthermore some children living in the household were coded as left home.
Initially both KID_LY (year of child's home leave) and KID_M (month of child's home leave) variables were constructed correctly, however due to reason that KID_L variable serves as filter for both variables then these variables eventually were changed to either ".b" (does not apply) or ".a" (unknown).
Since june 2014 KID_L is constructed in a long format. In addition children which died were excluded from KID_L=1 and are now coded with special missing code .d and KID_LY and KID_LM for dead children is coded as .b.

Filter: KID_Lx=.b if KID_x==0
\begin{tabular}{|l|l|l|}
\hline Child order & number of children & Left home \\
\hline 1 & 6124 & 2046 \\
\hline 2 & 4191 & 1160 \\
\hline 3 & 1066 & 339 \\
\hline 4 & 225 & 92 \\
\hline 5 & 46 & 22 \\
\hline 6 & 11 & 7 \\
\hline 7 & 6 & 4 \\
\hline 8 & 2 & \\
\hline 9 & 1 & \\
\hline
\end{tabular}
```

KID_LY\$: Year child left home
Filter: KID_LYx=.b if KID_x==0
KID_LYx=.b if KID_LX==0

```

KID_LM\$: Month child left home
Filter: KID_LMx=.b if KID_x==0
